

TO USE THE POCKET CASE AS A HOLDER

To avoid burns near heat, insert the stem into the pocket holder's built-in wrench and use the pocket holder as a handle. DO NOT rotate the head.

TO USE THE RE-CAL POCKET CASE FOR RECALIBRATION

The thermometer will withstand drops to the floor without damage or major calibration shift. If, however, it appears to be inaccurate, immerse the thermometer stem at least 2" in an ice slurry (32°F). Determine the degrees of inaccuracy. Then with the hex nut on the pocket case, rotate the thermometer head to correct the error. If the pocket case is not handy, a wrench or pliers may be used instead.
